

Terminal for Minerals

Fast and Reliable

At the terminal we handle and store minerals, industrial minerals and other bulk cargo mostly bauxite, borax, cement, phosphates, ilmenite, clinker, perlite, sintermagnesite, scrap, etc. serving the domestic and other hinterland markets in export and import. Our services are performed with modern technical machinery on closed, covered and open air facilities respecting the environmental standards.

On our terminal we have specialized equipment for handling sandy type alumina consisting of an unloading machine, a closed conveyor belt system, which feeds into a silo where the cargo is stored and a wagon loading system. In order to load wagons to full capacities we have a precise weighing device. The terminal and its quay are directly connected with the rail infrastructure as most of our cargo is transported by special wagons.

We load and unload up to four trainsets of different minerals daily and an additional one dedicated only to alumina traffics. All required operations at the port take place very quickly. A well-organized terminal and our adaptability in performing operations are a guarantee for the high quality of our services.

Additional services:

- sieving
- bagging (bags from 50 to 1,000 kg)
- stripping and stuffing of containers

Terminal for Minerals

Terminal in numbers

Different types of minerals

Operation quay	525 m
Sea depth	5 to 12.5 m
Berths	3
Closed and covered storage facilities	80,000 ton
Open storage facilities	40,000 ton

Special capacities for alumina

Sea depth	7.5 - 12 m
Berths	1
Storage capacity	20,000 ton
Unloading capacity	220 ton / hour
